

# Tagcrowd

**Tagcrowd works the same way as Wordle but with some advantages:**

- You can lemmatize words, i.e., consider some words as the same word (e.g., worked, work, works, working)
- You can exclude a set of words by copying and pasting a list of words NOT be counted for graphing.
- You can show the word count next to each word.

The screenshot shows the TagCrowd website interface. At the top, the TagCrowd logo is on the left, and the tagline "Create your own tag cloud from any text to visualize word frequency." is on the right. Below the logo is a navigation bar with links: Start Over, Blog, Help, Contact, and Patrons of TagCrowd. The main content area starts with the prompt "Choose your text source:". Below this are three buttons: "Paste Text", "Web Page URL", and "Upload File". The "Paste Text" button is selected. Below the buttons is a large text input area with a placeholder "Paste text to be visualized:" and a note "plain text, 500 kilobyte max". To the right of the input area is a "Visualize!" button. Below the input area is the "Options:" section. It includes several settings: "Language of text:" with a dropdown menu set to "English"; "Maximum number of words to show?" with a text input set to "50"; "Minimum frequency?" with a text input set to "1"; "Show frequencies?" with radio buttons for "no" (selected) and "yes"; "Group similar words? (English only)" with radio buttons for "no" and "yes" (selected); "Convert to lowercase?" with radio buttons for "lowercase" (selected) and "original"; and "Don't show these words:" with an empty text input field.

Contrary to Wordle where you can only copy and paste data, in TagCrowd you can upload data via a TEXT file. Only plain text files are accepted!!!
