

## Why do I get this screen when QGIS fires up?

The QGIS Project files expect to find the shapefile in a folder as originally set when creating the Project file. QGIS is complaining that it can no longer find the shapefile in the expected directory. You must have moved them!

To remedy click on the new file and then Browse to select the correct shapefile and save the project. You will not be able to save the project directly while running QGIS from PC-ACE. You need to save the project file externally on the appropriate project file

Not changing the shapefile will result in the following error!
