

Import a KML file in QGIS

To import a KML file created with PC-ACE in QGIS you have to click first on the button in the top left side or, from the menu, click on Layer, Add Layer, Add Vector Layer.

Then click on the “Browse” button and select the file to import. QGIS will add all the points in the KML file as you can see them in the map in any of the pictures. If you have a field named “Name” or “Description” in the kml file, QGIS will recognize those fields and add the data to the layer.

You can view the data associated to the layer by right clicking on the layer from the Layer Panel and then selecting “Open attribute table”.
